

```
double exampleMethod() {
```

```
    if (predicate) {  
        int x = 2;  
        internalMethodCall();  
        Object o = new Object();  
        Object o2 = factoryMethod(x);  
    }
```

Interesting

```
    print("other part");  
    int y = 12;  
    int z = 14;  
    double q = 4.0;  
    String t = "" + y + " " + z + ":" + q;  
    print("End method");  
    return q;
```

Uninteresting

```
}
```
